

## coachsmart LEV

# Why is the data on my coachsmart LEV always being set to "0"?

If the e-bike is switched off and the coachsmart LEV is not connected to any external sensor, it automatically switches to a 'sleep mode'. The coachsmart LEV is set in this way, because otherwise the battery consumption would be too high. Since the coachsmart LEV does not have an internal memory, the 'daily data' is always set to 0. However, this mode does not occur when the coachsmart LEV is connected to an ANT + sensor, such as a heart rate or speed sensor. In this case, the device always searches for the paired sensors and sleep mode does not occur.

The coachsmart LEV can be awakened from 'sleep mode' by pressing the middle button.
