

How does the altitude screen of the navi2coach work?

Note: Please download and install the latest device software by using the following instruction:

[64. How to update the firmware of my navi2coach?](#)

With the altitude screen, the rider is able to see his elevation in a chart. It shows an elevation chart if the loaded course file has altitude information (You need to copy old GPX files to the navi2coach again to use that!). If you aren't navigating, the altitude screen will show an elevation chart for the current recording.

There might be an information symbol on the upper left corner of the altitudescreen: It is shown when you are not on the loaded navigation course, because the drawn altitude profile can't be accurate for your current position.

Note: If a GPX file without altitude data is loaded, there will be no altitude screen.
