

How to show the altitude profile at the NaviControlCenter?

At the moment the altitude profile of recorded tracks only can be shown due to GoogleEarth.

1. Install GoogleEarth
2. Load the track to the NaviControlCenter and save it as KML file

Please consider that u need to store the file at a place you will find again as right now the standard data folder unfortunately will be: username/appdata/roaming/guiderap/data

1. Open the KML file via double click
2. GoogleEarth opens
3. Choose "show altitude profile" by right clicking on the driven tour
